

The Future of Biological Drain Treatment

How the Biodose Blocks Work

Biodose Block drain treatment products are shipped in solid, concentrated form and the chemicals are dissolved on-site at the point of application.

The battery powered dissolving unit is mounted to a wall or structure and connected to water supply.

The solution outlet of the dissolving unit is connected to a suitable drain upstream of the main drain outlet.

The dissolved product is timed to dispense when the establishment is not in operation.

Water is sprayed through a specially configured and calibrated spray nozzle up into the Biodose Block where the water dissolves a portion of the product and dispenses via gravity into the main drain system.
